DEEPSHIELD

Adaptive Explainable Deepfake Detection & Forensic Localization Report

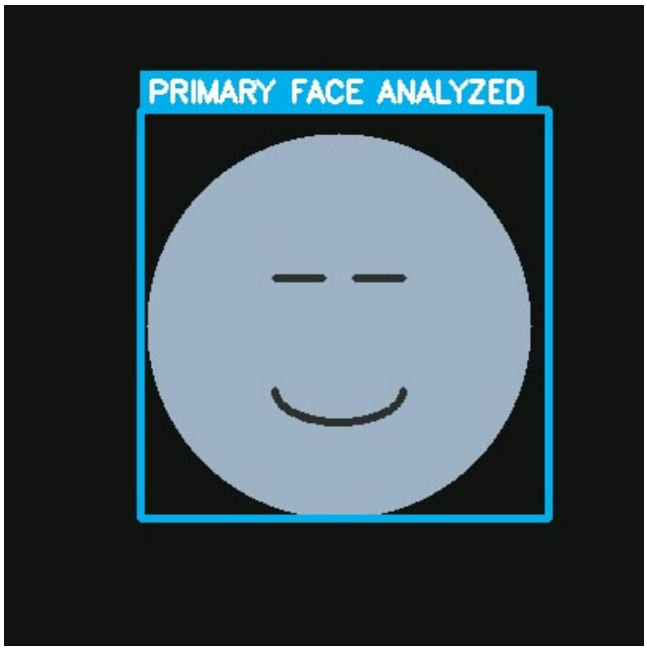
Report ID:	test_vid_123	**Date/Time:**	2026-10-07 22:25:56
File Name:	test_synthetic_video.mp4	**Media Type:**	Video
Verdict:	**REAL**	**Suspicion Score:**	**30.3%**
Duration:	3.0s	**Frames Analyzed:**	9
Peak Frame:	Frame 40	**Peak Timestamp:**	1.33s

1. Multi-Signal Evidence Breakdown

Signal Modality	Technique Used	Suspicion Level
Visual Evidence	EfficientNetB0 Spatial CNN	15.0%
Frequency Evidence	2D FFT Spectrum Energy Ratio	31.5%
Behavioral Evidence	MediaPipe Temporal Eye Blinking (EAR)	50.0%

2. Forensic Peak Frame Localization

The image below illustrates the frame with the highest suspicion score (30.3%) extracted at timestamp **1.33s** (Frame 40). The primary detected facial region is bounded below:



3. Suspicious Time Segments Detected

No continuous time segment exceeded the suspicion threshold (0.70).

4. Explainable Evidence Interpretation

"VERDICT: LIKELY AUTHENTIC MEDIA (Overall Suspicion: 30.3%). Natural visual facial characteristics detected. Standard spatial frequency distribution observed. Slightly irregular blinking rhythm observed across frames."

5. Forensic Disclaimers & System Limitations

Notice: DeepShield provides an AI-assisted detection score based on multi-signal feature heuristics, spatial CNN patterns, and frequency domain anomalies. This output does not constitute absolute legal or forensic proof of manipulation. Low-resolution media, extreme compression, or irregular lighting conditions may affect facial feature extraction accuracy.
